But the manufacturer gained special popularity thanks to the production of RAM. The company's production of this inexpensive solution for use with Intel's 2, 4, 6 and 8 core processors increases the speed of video editing, 3D rendering, and the maximum speed without having to manually adjust. Due to low voltage (1.2 V), energy consumption is reduced, which ensures that there is no heating and the memory module offered in black with a black printed circuit board complements the. Tagged repairs in process can be seen on lower shelves at left, and service parts in labeled boxes seen above them. The technician s responsibilities may extend to include building or configuring new hardware, installing and updating software packages, and creating and maintaining computer networks.Public sector computer repair technicians might work in the military, national security or law enforcement communities, health or public safety field, or an educational institution.

Despite the vast variety of work environments, all computer repair technicians perform similar physical and investigative processes, including technical support and often customer service. Experienced computer repair technicians might specialize in fields such as data recovery, system administration, networking or information systems. Some computer repair technicians are selfemployed or own a firm that provides services in a regional area. Some are subcontracted as freelancers or consultants. This type of computer repair technician ranges from hobbyists and enthusiasts to those who work professionally in the field.Some technicians provide onsite services, usually at an hourly rate. Others can provide services offsite, where the client can drop their computers and other devices off at the repair shop. Some have pickup and drop off services for convenience. Some technicians may also take back old equipment for recycling. This is required in the EU, under WEEE rules.Technicians involved in system administration might also work with networking hardware, including routers, switches, cabling, fiber optics, and wireless networks.Following a repair, an ideal scenario will give the user access to the same data and settings that were available to them prior to repair. To address a software problem, the technician could take an action as minor as adjusting a single setting or they may implore more involved techniques such as installing, uninstalling, or reinstalling various software packages. Advanced software repairs often involve directly editing keys and values in the Windows Registry or running commands directly from the command prompt. Anything unique such as settings or personal files will be destroyed if not backed up on external media, as this reverts everything back to its original unused state.This procedure may solve problems that have arisen after the time the restore point was created.

This is the process of recovering lost data from a corrupted or otherwise unaccessable hard drive.The entry level requirement is generally based on the extent of the work expected.These will be useful when seeking advanced, higher paying positions. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements. Assessment of performance is to be consistent with the evidence guide. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry preferred model for apprenticeships. However, where summative or final assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed. Sources of evidence need to be rich in nature to minimise error in judgment. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the Assessment Guidelines UEE07. Evidence shall also comprise A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment.

In particular this shall incorporate evidence that shows a candidate is able to It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified. This should include OHS policy and work procedures and instructions. It allows for different work environments and situations that will affect performance. Advertiser partners include American Express, Chase, U.S. Bank, and Barclaycard, among others. A Pew Research Center survey revealed that 84% of all American households have at least one smartphone. 80% have at least one desktop computer or laptop. 33% of all Americans live in households with three or more smartphones, and 18% are "hyperconnected," with 10 or more electronic devices in the home. In real terms, desktops and laptops are actually less costly to replace today than in 2010, but they're not exactly cheap. Refurbished electronics aren't as costly, but they lack the cachet of truly new products. WellMaintained Devices Live Longer Maintenance offers the best of both worlds. It's far cheaper than swapping burntout devices for new or used replacements, and it puts off the disruptive transition from one machine to the next.

Wellmaintained devices last years longer than maltreated equivalents, supporting smooth personal and professional use patterns and keeping more of your hardearned money in your wallet along the way. These electronic device maintenance tips are all well within the capabilities of the typical nonexpert computer user. Some are tailored to desktops and laptops. Others apply to a broader range of devices. Most are best done on a recurring basis. And none require excessive investments of time, effort, or money. A dirty keyboard will eventually stop working properly. Ditto for a dirty mouse. To clean your keyboard's more accessible surfaces, use a damp, lintfree cloth. Use the same approach to clean your mouse's accessible surfaces. To clean hardertoreach parts of your keyboard and mouse, such as the mouse's optical opening and the spaces underneath the keys, use a compressed air canister. Don't neglect laptop and desktop ports and crevices either. Dusty or particleclogged ports reduce airflow into and out of the device, increasing the risk of overheating. If you're prone to forgetting small tasks like this, set a recurring calendar reminder every month. 2. Gently Clean Your Monitor Your monitor might seem solid enough, but it's just as vulnerable to dust and debris as your keyboard and ports. Dust it periodically with a microfiber cloth. Easier said than done when you're working through your lunch break or bingewatching your favorite show with a bowl of ice cream, of course. But think of the consequences A single spill is enough to destroy a keyboard, and a highvolume dump could penetrate the device's casing and wreak havoc on its internal components. After prematurely KOing two keyboards in rapid succession, I instituted a new rule in my household nothing but water on the same surface as my laptop. It's not easy, but so far I've managed to hold fast. I highly recommend you do the same. 4.

Organize Cords and Other eDebris If you have an active home office setup, it probably features a mess of cords, power strips, and random accessories on the floors and working surfaces. This mess is unsightly and unwieldy at minimum. If you have small children or pets, it may well present an electrocution risk. Depending on how loadedup your power strips and outlets are, you could have a

fire hazard on your hands. And jumbled cords are more vulnerable to damage, meaning higher longterm ownership costs. Fixing this is easy. Unplug, detangle, and reorient your cords in your handy new organization system. Then plug everything back in. That's it. Pro Tip Seeking more home office hacks. Check out our post on the IRS home office tax deduction, then check with your tax advisor to determine whether you qualify. 5. Don't Overcharge Your Batteries Resist the temptation to keep your portable devices plugged in at all times. Not only is this a needless drain on your local power grid, which means preventable bloat for your utility bill, but it's also actively bad for your devices' batteries. Unnecessary charging actually retards batteries' regenerative capabilities. A year or so on, or maybe sooner, you'll notice a dropoff in your device's ability to hold a charge. Don't charge until your device is good and ready. I wait until my laptop gets down below 20%, for instance. 6. Don't Block the Vents Like people, desktop and laptop computers need to breathe. If it's possible to do so securely, elevate it to ensure good airflow on both sides. Periodically check that the fans are working as well. No matter what kind of device you have, maintain adequate ventilation and reasonable climate control. You don't have to blast the AC or leave the windows open in the winter, but setting the thermostat to 80 probably isn't a great idea either. 7. Have Desiccant on Hand You dropped your phone in the toilet. Oops! What's your next move.

With little hesitation, most people confidently answer "Put it in a jar of rice!" That's not the worst thing you could do for your waterlogged phone, but it's not the ideal fix either. Rice is merely the best desiccant, or drying agent, that most people have lying around the home. As it turns out, there are products made specifically to mop moisture out of electronics. An even cheaper alternative the little silica gel bags that come in many shipping boxes. Rather than throwing them out, collect them as they come in, taking care to store them somewhere child and petproof. Your hard drive is incredibly sensitive to magnetic fields of any strength. If you need to remember websites or phone numbers, use Postit notes or digital files instead. When in doubt, use a virtual private network VPN to encrypt your connection and repel attacks. Whether that's down to luck, exceptional care, or a mixture of the two, I'm not sure. I'm probably in the minority on this one. My wife cracked her last three screens, all under relatively mundane circumstances. Phones are resilient, but not indestructible. Drop them the wrong way and you'll be living with the consequences. The choice between purchasing a brand new phone or buying a protective enclosure to deflect kinetic energy is no choice at all. Ditto for screen protectors. While they won't protect against violent impacts, they'll resist scratching indefinitely under normal circumstances. Software and System Maintenance Tips These tips cover devices' hardware components, operating systems, memory, software, and vulnerability to external threats. 11. Shut It Down Properly Every Night Bake this into your nightly routine. It only takes a minute each day, and it could prolong your devices' life for months or years. It's especially important for Windows machines, since Microsoft only patches systems in shutdown mode. Also, how you shut down matters.

Avoid "cold booting" your machine holding down the power button until the system shuts itself off. Take the extra minute or two to shut down the machine properly, using your operating system's shutdown button. It's your call whether you want to apply this tip to your mobile devices. I personally only shut down my smartphone for updates, since I like to be available for emergency calls and alerts through the night. 12. Always Have Your Firewall Running Your operating system's firewall is your device's first line of defense against malware. With rare exceptions, it should always be up and running. This is especially important when you're installing new programs, and doubly so when you've downloaded the program files from a source other than the developer or manufacturer. Generally, you should avoid downloading any files from an unverified source. Turning on your firewall is easy. If you have a PC desktop or laptop, read Microsoft's primer here. Mac OSX v10.5.1 and later have application firewalls that provide protection for specific apps; you can read more about those here. Under some circumstances, your operating system's firewall can interfere with specific programs. This is an issue with certain multiplayer games and older versions of Apple

iTunes, for instance. If you suspect your firewall is fouling up your computing experience, check with the applicable program's developer for troubleshooting tips. 13. Regularly Delete Unwanted Programs Periodically canvass your system for unwanted programs that aren't overtly malicious. Experts term such programs "bloatware," and they can adversely impact your device's performance when allowed to accumulate over time. To detect bloatware, close as many open applications as you can, then open your operating system's task manager and see how many applications they actually recognize. You'll be shocked at how many programs still run in the background, eating up system resources.

Though some such programs are essential system processes, many are trivial and can safely be deleted. You need to execute a formal uninstall process for every single application you want to get rid of. Tossing things in the Trash or Recycle Bin doesn't cut it. Use the application's own uninstaller, if one exists. Generally speaking, uninstalling Windows programs is more complicated than uninstalling Mac equivalents, but you should still check with experts on your system to make sure you're doing things correctly. Sure as day follows night, these files will affect your system's speed and overall performance. An external hard drive is your best, and cheapest, bet. Moore's Law has been good to the external hard drive market. Drive cost has moved in nearinverse proportion to drive capacity. Malware developers and their "white hat" nemeses are perennially locked in mortal, globespanning struggle for advantage. Novel malware crops up just as fast as white hats neutralize it. Enter the systemwide malware scan. You should periodically run malware scans, ideally with more frequency than bloatware checks. This is especially important for PCs, which are more vulnerable to viruses, worms, and other malware. New laptops and PCs generally come with antimalware software preinstalled or at least included in the package, but be wary of accepting it at face value. Some antimalware software may cause more problems than it solves. In 2017, for instance, Best Buy stopped selling Moscowbased Kaspersky Lab's antivirus products under intense public pressure as concerns mounted that the company's software could function as a backdoor for covert monitoring and data extraction by the FSB and other Russian intelligence agencies. There's no replacement for due diligence. Refer to an authoritative source for recommendations on the ideal antimalware program for your specific system and needs PC Magazine has a good roundup here, for instance.
